# THE JASPER DIFFERENCE

## Turning A Recovery Project Into A Long-Term Partnership

### THE OPPORTUNITY

In 2018, a new client was facing costly delays after their contractor failed to install a competitor's gas processing plant. With construction deadlines already strained, they needed a proven partner to step in, take control, and get the project back on track. They needed someone who could bring the project across the finish line - and restore confidence in the field.

### OUR SOLUTION

Jasper executed the full installation of the facility and provided comprehensive balance of plant services. Our team met the client's aggressive schedule and ensured operational readiness, earning their trust and paving the way for future collaboration.

In 2022, that trust evolved into a new opportunity - the engineering, procurement, and construction of a 200 MMSCFD Jasper-designed cryogenic plant, featuring a custom stabilizer and a 500 GPM amine inlet treater, all delivered under our EPC model.

### THE PAYOFF

Jasper's proven performance turned a recovery project into a long-term, trusted partnership. The new 200 MMSCFD cryogenic facility was delivered on schedule, expanding the client's processing capacity with reliable, field-proven Jasper technology - setting the foundation for continued growth and success.
