

Texas & Oklahoma Delaware Basin, and Midcontinent

# THE JASPER DIFFERENCE

## Building Processing Capacity With Scalable, Multi-Plant Solutions

### THE OPPORTUNITY

In 2016, a midstream operator selected Jasper to support the expansion of their natural gas processing operations. With aggressive project schedules, the need for scalable capacity, and future growth in mind, they required a partner capable of delivering large-scale cryogenic infrastructure across multiple basins.

As the organization underwent a change of ownership during development, project continuity and execution remained critical. Jasper's proven performance ensured we remained a trusted partner, delivering consistent results through the transition.

### OUR SOLUTION

Jasper partnered with the operator to deliver cryogenic processing infrastructure across both the Midcontinent and the Delaware Basin. This included:

- A 60 MMSCFD cryogenic plant in Oklahoma
- A 200 MMSCFD cryogenic plant in Oklahoma
- Three 200 MMSCFD cryogenic plants at a single site in Reeves County, Texas - a site designed for ultimate 1.2 BCFD total processing capacity

In addition to the cryogenic plants, Jasper delivered inlet amine treating systems to support gas conditioning at the Texas complex. Our team maintained seamless project continuity across basins, delivering scalable capacity while supporting the operator's long-term development strategy - regardless of ownership changes.

### The Payoff

Through consistent execution and proven performance, Jasper has provided over 860 MMSCFD of total cryogenic processing capacity and associated treating systems across the operator's Oklahoma and Texas operations. From the Midcontinent to the Delaware Basin, Jasper has remained a trusted partner for greenfield developments, multi-plant sites, and scalable infrastructure designed to meet long-term production growth - regardless of market or organizational change.
